## Part I

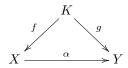

# Homotopy Theory

Let **TOP** be the category of topological spaces. Then we can take a quotient of **TOP** and get the homotopy category  $h - \mathbf{TOP}$ . The quotient may bring more algebraic structures. For example, Mor  $(S^1, X)$ , the homotopy classes of maps from  $S^1$  to X, is the fundamental group of X. Our goal is to study functors from hmotopy category to some algebraic categories.

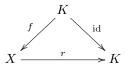

Let  $\mathbf{TOP}^o$  be the pointed topological category, where the sum is wedge sum  $(X, x_0) \land (Y, y_0) = X \sqcup Y/x_0 \sim y_0$  and the product is the smash product  $(X, x_0) \lor (Y, y_0) = X \times Y/\{x_0\} \times Y \cup X \times \{y_0\}$ . Similarly, we can take a quotient to get  $h - \mathbf{TOP}^o$ .

Let TOP(2) be the category of pairs and h - TOP(2) be its quotient.

Fix  $K \in \text{Ob}(\mathbf{TOP})$ . Let's consider  $\mathbf{TOP}^K$ , the category of spaces under K. Its objects are maps  $f \colon K \to X$  and morphisms are maps  $\alpha \colon X \to Y$  such that  $\alpha \circ f = g$ .

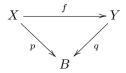

If  $K = \{*\}$  is a single point set, then  $\mathbf{TOP}^{\{*\}} = \mathbf{TOP}^o$  is the pointed topological category. Take X = K. A morphism from  $f: K \to X$  to id:  $K \to K$  is  $r: X \to K$  such that  $r \circ f = \mathrm{id}$ .

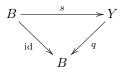

When  $K \subset X$ ,  $f = i : K \hookrightarrow X$ , we say that r is a retraction.

We have  $r: X \to K$  is a deformation retraction, if and only if  $i \circ r \simeq \mathrm{id}_X$  rel K, if and only if  $r: X \to K$  is a homotopy equivalence in  $\mathbf{TOP}^K$ .

Fix  $B \in \text{Ob}(\mathbf{TOP})$ . Let's consider  $\mathbf{TOP}_B$ , the category of spaces over B, where the objects are  $p: X \to B$  and morphisms are  $f: X \to Y$  such that  $p = q \circ f$ .

Take X = B. A morphism from id:  $B \to B$  to  $q: Y \to B$  is  $s: B \to Y$  such that  $q \circ s = \mathrm{id}_B$ .

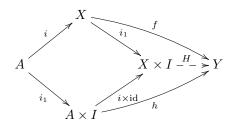

Then s is called a section of q.

Similarly, we can define  $h - \mathbf{TOP}^K$  and  $h - \mathbf{TOP}_B$ .

# 1 Cofibrations and Fibrations

## 1.1 Cofibrations

**Definition 1.1.** A map  $i: A \to X$  has the homotopy extension property (HEP) for a space Y if for all homotopy  $h: A \times I \to Y$  and  $f: X \to Y$  with  $f \circ i(a) = h(a, 1)$ , there exists  $H: X \times I \to Y$  satisfies

We say  $i: A \to X$  is a cofibration if it has HEP for each  $Y \in \text{Ob}(\mathbf{TOP})$ .

Recall the mapping cylinder: if  $i: A \to X$  is a map, then  $Z(i) := (A \times I) \sqcup X/(a,1) \sim i(a)$ .

**Proposition 1.2.** Given a map  $i: A \to X$ . The followings are equivalent:

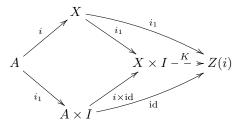

- 1.  $i: A \to X$  is a cofibration.
- 2. i has HEP for Z(i).
- 3. The map

$$s \colon Z(i) \to X \times I$$
$$(a,t) \mapsto (i(a),t),$$
$$x \mapsto (x,1)$$

has a retraction.

*Proof.*  $(1)\Longrightarrow(2)$  is only by definition.

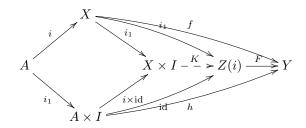

(2) $\Longrightarrow$ (1): By definition, there exists  $K \colon X \times I \to Z(i)$  such that the following diagram is commutative.

For any Y and homotopy  $h: A \times I \to Y$  and  $f: X \to Y$  with  $f \circ i(a) = h(a, 1)$ , we define

$$F: Z(i) \to Y$$
  
 $(a,t) \mapsto h(a,t)$   
 $x \mapsto f(x).$ 

Then  $F \circ K$  is as desired.

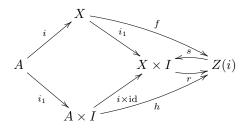

(2) $\Longrightarrow$ (3): We can easily check that the extension  $K: X \times I \to Z(i)$  in the proof of (2) $\Longrightarrow$ (1) is a retraction of s.

(3) $\Longrightarrow$ (2): Let r be a retraction of s. For any homotopy  $h: A \times I \to Z(i)$  and  $f: X \to Z(i)$  with  $f \circ i(a) = h(a, 1)$ , we define

$$\sigma \colon Z(i) \to Z(i)$$
$$(a,t) \mapsto h(a,t)$$
$$x \mapsto f(x).$$

Then we can verify that  $H = \sigma \circ r \colon X \times I \to Z(i)$  extends h.

**Corollary 1.3.** When  $A \subset X$  is a close subset,  $i: A \hookrightarrow X$  is the inclusion map. Then  $i: A \to X$  is a cofibration  $\iff Z(i) = A \times I \cup X \times \{1\}$  is a retraction of  $X \times I$ .

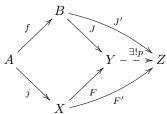

Therefore, we can construct many cofibrations. For example, let (X, A) be a manifold with boundary, then  $i \colon A \hookrightarrow X$  is a cofibration.

#### 1.1.1 Push-Out of Cofibration

Given a commutative diagram,

$$\begin{array}{ccc}
A & \xrightarrow{f} & B \\
\downarrow j & & \downarrow J \\
X & \xrightarrow{F} & Y
\end{array}$$

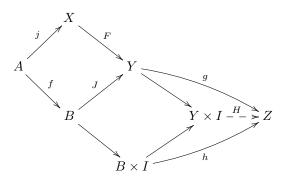

the push-out of j along f is the initial object of this diagram, i.e.  $j: B \to Y, F: X \to Y$ , s.t.  $\forall Z$  with  $J': B \to Z, F': X \to Z$  satisfying  $J' \circ f = F' \circ j$ ,  $\exists !$  map  $p: Y \to Z$  such that the diagram is commutative.

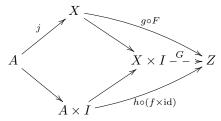

In our setting, we can construct  $Y = X \sqcup B/f(a) \sim j(a)$  directly.

**Proposition 1.4.** If  $j: A \to X$  is a cofibration, then the push-out of j along  $f: B \to Y$  is also a cofibration.

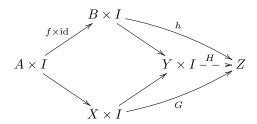

*Proof.* For any  $Z, g: Y \to Z, h: B \times I \to Z$  such that  $g \circ J = h \circ (i_1 \times id)$ , we need to find  $H: Y \times I \to Z$  such that the following diagram is commutative.

Because  $j:A\to X$  is a cofibration, we have  $G\colon X\times I\to Z$  such that the following diagram is commutative.

Using the fact that  $J \times \text{id} : B \times I \to Y \times I$  is also the push-out of  $j \times \text{id} : A \times I \to X \times I$  along  $f \times \text{id} : A \times I \to B \times I$ , we have unique  $H : Y \times I \to Z$  such that the following diagram is commutative.

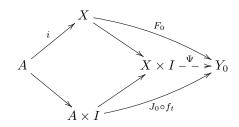

The  $H: Y \times I \to Z$  is the extension of  $h: B \times I \to Z$ , as desired.

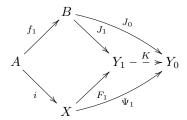

In terms of categorical language, let  $\Pi(A, B)$  be a category, whose objects are continue maps from A to B and morphisms are homotopy of maps from A to B. Consider  $\mathbf{COF}^B \subset \mathbf{TOP}^B$  the subcategory of cofibrations under B (i.e.  $J \colon B \to Y$ ). Then we have homotopy category  $h - \mathbf{COF}^B$ . Given a cofibration  $i \colon A \to X$ , we get a contravariant functor

$$\beta \colon \Pi(A,B) \to h - \mathbf{COF}^B$$
.

In fact, we only need to check that if  $f_0 \simeq f_1 \colon A \to B$ , then we get a morphism from  $J_0 \colon B \to Y_0$  to  $J_1 \colon B \to Y_1$ . Firstly, consider the homotopy  $J_0 \circ f_t \colon A \times I \to Y_0$ , we get its extension  $\Psi \colon X \times I \to Y_0$ .

Then by the universal property of the push-out  $J_1: B \to Y_1$  of i along  $f_1$  for  $J_0: B \to Y_0$  and  $\Psi_1: X \to Y_0$ , we get a map  $K: Y_1 \to Y_0$ , as desired.

#### 1.1.2 Replacing a Map by a Cofibration

Given a map  $f: X \to Y$ , consider the mapping cylinder Z(f). We can notice that Z(f) is the push-out.

$$X \xrightarrow{f} Y$$

$$\downarrow s$$

$$X \times I \xrightarrow{a} Z(f)$$

We also have a map

$$q \colon Z(f) \to Y$$
  
 $(x,t) \mapsto f(x).$ 

Note that by Proposition 1.2,  $i_1: X \hookrightarrow X \times I$  is a cofibration  $\iff X \times \{1\} \times I \cup X \times I \times \{1\}$  is a retraction of  $X \times I \times I$ , we have  $s: Y \to Z(f)$  is a cofibration.

#### Proposition 1.5. Let

$$j: X \to Z(f)$$
  
 $x \mapsto (x, 0),$ 

we have

- 1.  $j: X \to Z(f)$  is a cofibration.
- 2.  $s \circ q \simeq \mathrm{id}_{Z(f)}$  rel Y.
- 3. If f is a cofibration, then  $q: Z(f) \to Y$  is a homotopy equicalence in  $\mathbf{TOP}^X$ .

*Proof.* (1). We construct a retraction  $R: Z(f) \times I \to X \times I \cup Z(f) \times \{1\}$  as follow. Let  $R': I \times I \to I \times \{1\} \cup \{0\} \times I$  be a retraction. Then we define

$$\begin{aligned} R \colon Z(f) \times I &\to X \times I \cup Z(f) \times \{1\} \\ ((x,s),t) &\mapsto (x,R'(s,t)) \\ (y,t) &\mapsto (y,1) \end{aligned}$$

is as desired. By Proposition 1.2,  $j: X \to Z(f)$  is a cofibration.

(2). The homotopy

$$h_t \colon Z(f) \to Z(f)$$
  
 $(x, \sigma) \mapsto (x, (1-t)\sigma + t)$ 

is as desired.

(3). By Proposition 1.2, there is a retraction  $r: Y \times I \to Z(f)$ . Define

$$g \colon Y \to Z(f)$$
  
 $y \mapsto r(y, 1).$ 

One can verifies that g is the homotopy inverse of q.

**Summery 1.** Any map  $f: X \to Y$  factors into

$$X \xrightarrow{j} Z \xrightarrow{q} Y$$

where  $j \colon X \to Z$  is a cofibration and  $q \colon Z \to Y$  is a homotopy equivalence. Moreover, such a factorization is unique up to homotopy equivalence. In particular, we can choose Z = Z(f). We define  $C_f = Z(f)/\operatorname{im} j$  as the homotopy cofibre of f, i.e.  $C_f = X \times I \sqcup Y/(x,0) \sim *, (x,1) \sim f(x)$ , is called the mapping cone of f.

$$X \xrightarrow{f} Y \xrightarrow{s} C_f$$

## 1.1.3 The Cofibre Sequence (Puppe's Sequence)

To get finer structure, we work in  $\mathbf{TOP}^o$ . Given a map  $f: (X, x_0) \to (Y, y_0)$ , we get an induced map

$$f^* \colon [Y, B]^o \to [X, B]^o$$
  
 $[\alpha] \mapsto [f \circ \alpha],$ 

where  $[X, B]^o$  is the homotopy class of basepoint preserving maps. In particular, we have the constant map

$$[*]: X \to B$$
  
 $x \mapsto b_0.$ 

**Definition 1.6.** We say a sequence

$$(X, x_0) \xrightarrow{f} (Y, y_0) \xrightarrow{g} (Z, z_0)$$

in  $\mathbf{TOP}^o$  is h-coexact if  $\forall (B, b_0) \in \mathrm{Ob}(\mathbf{TOP}^o)$ ,

$$[Z,B]^o \xrightarrow{g^*} [Y,B]^o \xrightarrow{f^*} [X,B]^o$$

is exact, i.e.  $(f^*)^{-1}([*]) = \text{im } g^*$ .

In **TOP**<sup>o</sup>, we consider the reduced mapping cone  $CX := X \times I/X \times \{0\} \cup \{x_0\} \times I$ . The basepoint of CX is  $X \times \{0\} \cup \{x_0\} \times I$ . And we consider the reduced mapping cone: For  $f: (X, x_0) \to (Y, y_0)$ ,  $C(f) := CX \vee Y/(x, 1) \sim f(x)$ . It is equivalent to the following push-out diagram.q

$$X \xrightarrow{f} Y$$

$$\downarrow_{i_1} \qquad \qquad \downarrow_{f_1}$$

$$CX \longrightarrow C(f)$$

In fact,  $f_1$  maps y to (y, 1).

We will also use symbol X instead of  $(X, x_0)$  in  $\mathbf{TOP}^o$  for short.

#### **Proposition 1.7.** The sequence

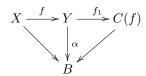

$$X \xrightarrow{f} Y \xrightarrow{f_1} C(f)$$

is h-coexact.

*Proof.* Consider the following sequence

$$[C(f), B]^o \xrightarrow{f_1^*} [Y, B]^o \xrightarrow{f^*} [X, B]^o$$

for any  $(B, b_0)$ .

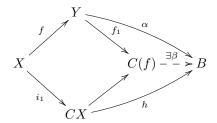

Assume that  $[\alpha] \in [Y,B]^o$  s.t.  $[\alpha \circ f] = [*] \in [X,B]^o$ , i.e.  $\alpha \circ f$  is null-homotopic. This is equivalent that there exists a map  $h \colon CX \to B$ . The mapping cone C(f) is the push-out of

$$X \xrightarrow{f} Y$$

$$\downarrow_{i_1} \qquad \qquad \downarrow_{f_1}$$

$$CX \longrightarrow C(f)$$

Using the universal property of push-out, we have the following commutative diagram,

i.e.  $\alpha = \beta \circ f_1$ . Therefore  $[\alpha] = f_1^*[\beta]$  and this proposition follows.

Iterate the procedure, we get a long h-coexact sequence:

$$X \xrightarrow{f} Y \xrightarrow{f_1} C(f) \xrightarrow{f_2} C(f_1) \xrightarrow{f_3} C(f_2) \xrightarrow{} \cdots$$

Consider the injection  $j_1: CY \to C(f_1)$ , we have that

$$C(f_1)/j_1(CY) = X \times I/X \times \partial I \cup \{x_0\} \times I = \Sigma X$$

 $q(f) \colon C(f_1) \to \Sigma X.$ 

is the reduced suspension of X. Then we get a quotient map

$$\begin{vmatrix}
f & & \\
X & Y & C(f)
\end{vmatrix}$$

$$C(f_1) & \Sigma X$$

Claim 1. q(f) is a homotopy equivalence.

Denote by  $s(f): \Sigma X \to C(f_1)$  the homotopy inverse of q(f). Then our original sequence becomes

$$X \xrightarrow{f} Y \xrightarrow{f_1} C(f) \xrightarrow{f_2} C(f_1) \xrightarrow{f_3} C(f_2)$$

$$\downarrow^{q(f)} \downarrow^{q(f)}$$

$$\Sigma X$$

Consider the following diagram.

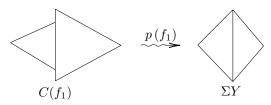

$$C\left(f_{1}\right) \xrightarrow{f_{3}} C\left(f_{2}\right)$$

$$q(f) \middle| \begin{matrix} \downarrow \\ s(f) \end{matrix} \middle| \begin{matrix} \downarrow \\ s(f) \end{matrix} \middle| \begin{matrix} \downarrow \\ q(f_{1}) \end{matrix}$$

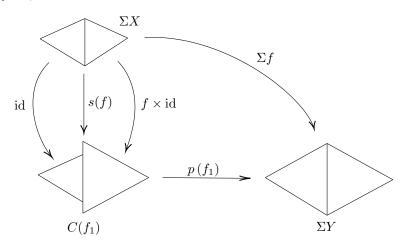

$$\Sigma X \xrightarrow{-} \xrightarrow{-} \Sigma Y$$

$$q(f_{1}) \circ f_{3} \circ s(f)$$

Claim 2. Consider  $\tau \colon \Sigma X \to \Sigma X$  which maps (x,t) to (x,1-t), we have  $q(f_1) \circ f_3 \circ s(f) \simeq \Sigma f \circ \tau$ To prove it, denote  $p(f_1) = q(f_1) \circ f_3$ . In fact,  $p(f_1)$  retracts the left triangle, i.e. CX to a point.

In the following diagram, s(f) is the union of id and  $f \times id$ , i.e. id maps the left triangle of  $\Sigma X$  to the left triangle of  $C(f_1)$ ,  $f \times id$  maps the right triangle of  $\Sigma X$  to the right triangle of  $C(f_1)$ . Then  $\Sigma f = p(f_1) \circ s(f)$  naturally. Notice that  $\tau$  flips  $\Sigma X$  left and right. Therefore, by symmetry, we have  $p(f_1) \circ s(f) \simeq \Sigma f \circ \tau$ , as desired.

Now we get

$$X \xrightarrow{\quad f \quad} Y \xrightarrow{\quad f_1 \quad} C(f) \xrightarrow{p(f) \quad} \Sigma X \xrightarrow{\quad \Sigma f \quad} \Sigma Y \xrightarrow{\quad (\Sigma f)_1} C(\Sigma f)$$

Claim 3. There is a homeomorphism  $\tau_1 \colon C(\Sigma f) \to \Sigma C(f)$  such that the following diagram is commutative.

$$\Sigma Y \xrightarrow{(\Sigma f)_1} C(\Sigma f)$$

$$\downarrow^{\tau_1}$$

$$\Sigma C(f)$$

In fact, regard both  $C(\Sigma f)$  and  $\Sigma C(f)$  as the quotient spaces of  $X \times I \times I$  unioned with Y,  $\tau_1$  is induced from interchanging the two I-factors.

As conclusion, we have

**Theorem 1.8** (Puppe's Sequence). The sequence

$$X \xrightarrow{f} Y \xrightarrow{f_1} C(f) \xrightarrow{p(f)} \Sigma X \xrightarrow{\Sigma f} \Sigma Y \xrightarrow{\Sigma f_1} \Sigma C(f) \xrightarrow{p(\Sigma f)} \Sigma^2 X \longrightarrow \Sigma^2 Y \longrightarrow \cdots$$

is h-coexact.

#### 1.2 Fibrations

**Definition 1.9.** A map  $p: E \to B$  has the homotopy lifting property (HLP) for the space X if  $\forall$  homotopy  $h: X \times I \to B$  and  $a: X \to E$  s.t.  $p \circ a(x) = h(x, 0)$ , there exists a homotopy  $H: X \times I \to E$  s.t.  $p \circ H = h$ . H is called a lifting of h.

$$X \xrightarrow{a} E$$

$$\downarrow i_0 \downarrow H \nearrow \downarrow p$$

$$X \times I \xrightarrow{h} B$$

A map  $p: E \to B$  is called a fibration if it has HLP for all spaces X.

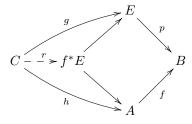

**Definition 1.10.** Given maps  $f: A \to B$  and  $p: E \to B$ . The pull-back of p along f is the terminal object of the following diagram,

$$f^*E \longrightarrow E$$

$$\downarrow \qquad \qquad \downarrow^p$$

$$A \longrightarrow B$$

i.e. for any  $C, g: C \to E, h: C \to A$ , there exists unique r such that the following diagram is commutative.

Explicity,

$$f^*E = \{(a, e) \in A \times E : f(a) = p(e)\}$$

and  $\pi \colon f^*E \to A$  is the projection.

Denote  $B^I = \text{Map}(I, B)$ . Consider the pull-back

$$W(p) \coloneqq \left\{ (x, w) \in E \times B^I : p(x) = w(0) \right\}$$

which is given by the pull-back

$$W(p) \xrightarrow{k} B^{I}$$

$$\downarrow b \qquad \qquad \downarrow e^{0}$$

$$E \xrightarrow{n} B$$

where  $e^0$  maps w to w(0).

**Proposition 1.11.** Given a map  $p: E \to B$ , the followings are equivalence:

- 1.  $p: E \to B$  is a fibration.
- 2. p has HLP for W(p).

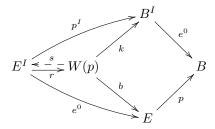

3.

$$r \colon E^I \to W(p)$$
  
 $\alpha \mapsto (\alpha(0), p \circ \alpha)$ 

admits a section.

*Proof.*  $(1) \Longrightarrow (2)$  is by definition.

(2) $\Longrightarrow$ (3): Because W(p) is a pull-back, by its universal property, we have the following diagram and we want to find s such that  $r \circ s = \mathrm{id}$ .

Notice that Map  $(W(p), E^I) = \text{Map}(W(p) \times I, E)$ , because p has HLP for W(p), we have the following commutative diagram.

$$W(p) \xrightarrow{b} E$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow p$$

$$W(p) \times I \xrightarrow{k} B$$

We have  $b \circ r \circ s = e^0 \circ s = b$  and  $k \circ r \circ s = p^I s = k$ . Using the universal property (uniqueness) of pull-back W(p) for W(p), we must have  $r \circ s = \mathrm{id}$ , i.e. s is a section of r.

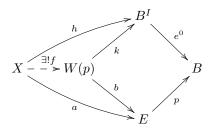

(3) $\Longrightarrow$ (1): Let s be the section of r. For any X, a, h as in the definition of fibration, we want to find H such that the following diagram is commutative.

$$X \xrightarrow{a} E$$

$$\downarrow i_0 \qquad \downarrow f \qquad \downarrow p$$

$$X \times I \xrightarrow{h} B$$

Using the universal property of pull-back W(p), we have unique f such that the following diagram is commutative, where  $h: X \to B^I$  is the same as  $h: X \times I \to B$ .

Then because Map  $(W(p), E^I) = \text{Map}(W(p) \times I, E)$ , one can check that  $H = s \circ f$  is as desired. In fact,

$$p \circ H(x,t) = (p \circ H(x))(t) = (k \circ r \circ s \circ f(x))(t) = (k \circ \operatorname{id} \circ f(x))(t) = h(x,t)$$

and  $H \circ i_0 = a$  is similar.

#### 1.2.1 Pull-back of Fibration

**Proposition 1.12.** If  $p: E \to B$  is a fibration, then  $f^*E \to A$  is also a fibration.

*Proof.* In the following diagram, F is induced by HLP for fibration  $p: E \to B$  and then H is induced by universal property of pull-back  $f^*E$ .

#### 1.2.2 Replacing Maps by Fibration

**Proposition 1.13.** The evaluation  $e^1: Y^I \to Y$ ,  $w \mapsto w(1)$  is a fibration.

*Proof.* We can define H directly:

$$\begin{aligned} T \colon X \times I \to Y^I \\ (x,s) \mapsto \begin{cases} [t \mapsto a|_X((1+s)t)], & when \ 0 \le (1+s)t \le 1 \\ [t \mapsto h(x,(1+s)t-1)], & when \ (1+s)t \ge 1. \end{cases} \\ X \xrightarrow{a \to Y^I} V \xrightarrow{b \to Y} V \xrightarrow{b \to Y} V$$

Given  $f: X \to Y$ , consider the following pull-back.

$$W(f) = f^*Y^I \longrightarrow Y^I$$

$$\downarrow_{e^1}$$

$$X \xrightarrow{f} Y$$

In fact,

$$W(f) = \{(x, w) \in X \times Y^I : f(x) = w(1)\}.$$

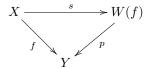

Denote  $p: W(f) \to Y$ ,  $(x, w) \mapsto w(0)$  and  $s: X \to W(f)$ ,  $x \mapsto (x, k_{f(x)})$  where  $k_{f(x)}$  is a constant path at f(x), and  $q: W(f) \to X$ ,  $(x, w) \mapsto x$ . We can check that the following diagram is commutative.

$$W(f) = f^*Y^I \longrightarrow Y^I$$

$$\downarrow i_0 \mid \uparrow s \qquad p \qquad \downarrow e^1$$

$$X \longrightarrow Y$$

**Theorem 1.14.** In the following commutative diagram,

s is a homotopy equivalence and p is a fibration.

*Proof.* Consider the following fibration

$$\begin{array}{c|c} (f \times \mathrm{id})^* Y^I & \longrightarrow Y^I \\ \downarrow (q,p) & & \downarrow (e^1,e^0) \\ X \times Y & \xrightarrow{f \times \mathrm{id}} Y \times Y \end{array}$$

Claim 4.  $(f \times id)^*Y^I = W(f)$ .

To see that, notice that

$$(f \times id)^* Y^I = \{(x, y, w) \in X \times Y \times Y^I : f(x) = w(1), y = w(0)\},\$$

we can construct a map from W(f) to  $(f \times id)^*Y^I$  that maps (x, w) to (x, w). It's one to one.

Then  $p: W(f) \to Y$  is a fibration if and only if  $(f \times id)^*Y^I \xrightarrow{(q,p)} X \times Y \xrightarrow{p_2} Y$  is a fibration. It's a composition of two fibration and then a fibration, as desired.

Claim 5. q is a homotopy inverse of s.

By this theorem, given any  $f: X \to Y$ , we can replace it by a fibration  $p: W(f) \to Y$  homotopically. Then we can define the homotopy fibre at  $y_0$  of  $f: X \to Y$  to be

$$F(f) := p^{-1}(y_0) = \{(x, w) \in X \times Y^I : f(x) = w(1), y_0 = w(0)\}.$$

**Remark 1.15.** Apply HLP again, we can prove the factorization  $f = s \circ p \colon X \to Y$  such that  $s \colon X \to W$  is a homotopy equivalence and  $p \colon W \to Y$  is a fibration. And this factorization is unique up to homotopy equivalence.

**Theorem 1.16.** Let  $p: E \to B$  be a fibration and B is path-connected. Then all fibres  $p^{-1}(b)$  are homotopy equivalent.

*Proof.* Given a path  $\alpha: I \to B$ ,  $\alpha(0) = b_0$  and  $\alpha(1) = b_1$ . Consider HLP property:

$$p^{-1}(b_0) \xrightarrow{F} E$$

$$\downarrow \qquad \qquad \downarrow p$$

$$p^{-1}(b_0) \times I \xrightarrow{h} B$$

where  $h(x,t) = \alpha(t)$ . Consider  $H_1: p^{-1}(b_0) \to p^{-1}(b_1)$  the restriction of H at t = 1. Similarly, consider the reversed path  $\overline{\alpha}$  of  $\alpha$ , we get  $\overline{H_1}: p^{-1}(b_1) \to p^{-1}(b_0)$ .

Claim 6.  $\overline{H_1} \circ H_1 \simeq id$ .

It's by applying homotopy lifting to the homotopy from  $\overline{\alpha}\alpha$  to  $k_{b_0}$ . Therefore, all fibres  $p^{-1}(b)$  are homotopy equivalent.

#### 1.2.3 Fibre Exact Sequence (Puppe's Sequence)

**Definition 1.17.** We say a sequence of pointed maps

$$(X, x_0) \xrightarrow{f} (Y, y_0) \xrightarrow{g} (Z, z_0)$$

is h-coexact if  $\forall (B, b_0)$ , the induced sequence

$$[B,X]^o \xrightarrow{f_*} [B,Y]^o \xrightarrow{g_*} [B,Z]^o$$

is exact, i.e.  $g_*^{-1}([c_{z_0}]) = \operatorname{im} f_*$ .

Recall the homotopy fibre of  $f: X \to Y$  is

$$F(f) := p^{-1}(y_0) = \{(x, w) \in X \times Y^I : f(x) = w(1), y_0 = w(0)\}.$$

Denote  $f^1: F(f) \to X$ ,  $(x, w) \mapsto x$ .

**Proposition 1.18.** For any  $f: (X, x_0) \to (Y, y_0)$ , the sequence

$$F(f) \xrightarrow{f^1} X \xrightarrow{f} Y$$

is h-coexact.

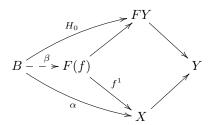

*Proof.* Assume  $\alpha: B \to X$  satisfies  $f \circ \alpha: B \to Y$  is null-homotopic and  $f_*[\alpha] = [c_{y_0}]$ . Apply HLP property:

$$B \longrightarrow FY = \{ w \in Y^I : w(0) = y_0 \}$$

$$\downarrow e^1$$

$$B \times I \longrightarrow Y$$

where h is a null-homotopy from  $f \circ \alpha$  to  $c_{y_0}$ . Notice that  $H_0: B \times \{1\} \to FY$  satisfies

where  $\beta$  is induced by the universal property of the pull-back F(f), such that  $f^1 \circ \beta = \alpha$ . Therefore,  $f_*^1([\beta]) = [\alpha]$ .

Iterate the procedure, we get a long h-exact sequence

$$\cdots \longrightarrow F(f^2) \xrightarrow{f^3} F(f^1) \xrightarrow{f^2} F(f) \xrightarrow{f^1} X \longrightarrow Y$$
.

Question 1.19. How to understand  $F(f^n) \xrightarrow{f^{n+1}} F(f^{n-1})$ ?

We consider the loop space

$$\Omega Y := \{ w \in Y^I : w(0) = w(1) = y_0 \}.$$

Notice that

$$\left(f^{1}\right)^{-1}(x_{0})=\left\{ (x_{0},w)\in X\times Y^{I}:w(0)=y_{0},w(1)=f\left(x_{0}\right)=y_{0}\right\} ,$$

we have  $\Omega Y = (f^1)^{-1}(x_0)$ . We write  $i(f): \Omega Y \to F(f)$  for the inclusion.

Theorem 1.20 (The puppe's fibre sequence). The sequence

$$\Omega^k F(f) \xrightarrow{\Omega^k f^1} \Omega^k X \xrightarrow{\Omega^k f} \Omega^k Y \xrightarrow{\Omega^k f} \Omega^k Y \xrightarrow{i \left(\Omega^{k-1} f\right)} \cdots \longrightarrow \Omega X \longrightarrow \Omega Y \longrightarrow F(f) \xrightarrow{f^1} X \longrightarrow Y$$

is h-exact.

Proof. Step 1:

$$F(f^{1}) = \{(x, w, v) \in X \times Y^{I} \times X^{I} : w(0) = y_{0}, v(0) = x_{0}, w(1) = f(x), v(1) = x\}$$
$$= \{(w, v) \in Y^{I} \times X^{I} : w(0) = g_{0}, v(0) = x_{0}, w(1) = f(v(1))\}.$$

Define  $j(f): \Omega Y \to F(f^1), w \mapsto (w, k_{x_0}).$ 

Claim 7. j(f) is a homotopy equivalence.

In fact, define  $r(f) \colon F\left(f^1\right) \to \Omega Y$ ,  $(w,v) \mapsto w * \overline{(f \circ v)}$ , then  $r(f) \circ j(f) = \mathrm{id}$ . The homotopy from  $\mathrm{id}_{F(f^1)}$  to  $j(f) \circ r(f)$  is  $h_t(w,v) = \left(h_t^1,h_t^2\right)$ , where  $h_t^1(s) = \begin{cases} w(s(1+t)), \ s(1+t) \leq 1, \\ f(v(2-(1+t)s)), \ s(1+t) \geq 1 \end{cases}$  and  $h_t^2(s) = v(s(1-t))$ .

Step 2: From  $F\left(f^{1}\right) \xrightarrow{f^{2}} F(f) \xrightarrow{f^{1}} X$ , we get

$$F\left(f^{2}\right) \xrightarrow{f^{3}} F\left(f^{1}\right)$$

$$j(f^{1}) \uparrow \qquad \downarrow j(f^{1}) \qquad \uparrow j(f)$$

$$\Omega X \xrightarrow{\Omega f} \Omega Y$$

Because  $j\left(f^{1}\right)$  is a homotopy equivalence, we have  $i\left(f^{1}\right)\simeq j(f)\circ\Omega f.$ 

Step 3: Now we have  $\Omega X \xrightarrow{\Omega f} \Omega Y i(f) \longrightarrow F(f)$ . Then we get  $F\Omega f \longrightarrow \Omega X \xrightarrow{\Omega f} \Omega Y$ .

Claim 8.  $F(\Omega f)$  is homotopy equivalent to  $\Omega F(f)$ .

To see that, notice that  $F(\Omega f)$  and  $\Omega F(f)$  are all quotient of  $\operatorname{Map}(I \times I, Y)$ . Finally, we get the h-exact sequence

$$\Omega F(f) \longrightarrow \Omega X \longrightarrow \Omega Y \longrightarrow F(f) \longrightarrow X \longrightarrow Y$$
.

#### 1.3 Duality of Cofibration and Fibration

#### 1.3.1 Duality of Reduced Suspension and Loop Space

Write  $Y^X = \text{Map}(X, Y)$  equipped with compact-open topology. We define the adjunction

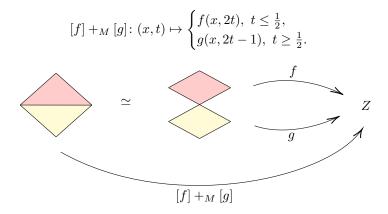

$$\alpha \colon Z^{X \times Y} \to \left(Z^Y\right)^X$$

$$f \mapsto [x \mapsto f(x, \cdot)].$$

**Theorem 1.21.** Suppose that X and Y are locally compact. Then  $\alpha$  is a homeomorphism.

In the pointed version, we replace  $X \times Y$  by  $X \wedge Y = X \times Y / \{x_0\} \times Y \cup X \times \{y_0\}$  and  $\operatorname{Map}^o(X,Y)$  is the space of basepoint preserving maps. Then  $\alpha^o \colon \operatorname{Map}^o(X \wedge Y,Z) \to \operatorname{Map}^o(X,\operatorname{Map}^o(Y,Z))$  is a homeomorphism. Therefore,  $\alpha^o$  induces a bijection  $\alpha_*^o \colon [X \wedge Y,Z]^o \to [X,\operatorname{Map}^o(Y,Z)]^o$ .

Choose  $Y = S^1 = I/\partial I$ , then  $X \wedge Y = X \times I/X \times \partial I \cup \{x_0\} \times I = \Sigma X$  is the reduced suspension of X and  $\operatorname{Map}^o(Y, Z) = \Omega Z$  is the loop space of Z. Therefore, we get a bijection  $\alpha_*^o : [\Sigma X, Z]^o \to [X, \Omega Z]^o$ . On  $[\Sigma X, Z]^o$ , we have a group structure:

Let  $\tau$  be the inversion of  $\Sigma X$ . For any [f],  $-[f] = [f \circ \tau]$ . On  $[X, \Omega Z]^o$ , we have

$$\begin{split} m\colon \Omega Z\times \Omega Z &\to \Omega Z \\ (u,v) &\mapsto u*v. \end{split}$$

Define

$$[f] +_m [g] := [m \circ (f \times g) \circ d],$$

where

$$d \colon X \to X \times X$$
  
 $x \mapsto (x, x)$ 

is the diagonal embedding.

One can verify that

$$\alpha_*^o([f] +_M [g]) = \alpha_*^o([f]) +_m \alpha_*^o([g]).$$

Then the adjunction map  $\alpha_*^o: [\Sigma X, Z]^o \to [X, \Omega Z]^o$  is an isomorphism. In categorical language, this means  $\operatorname{Mor}(\Sigma X, Z) = \operatorname{Mor}(X, \Omega Z)$  in  $\operatorname{\mathbf{TOP}}^o$ . As conclusion,  $\Sigma: \operatorname{\mathbf{TOP}}^o \to \operatorname{\mathbf{TOP}}^o$  and  $\Omega: \operatorname{\mathbf{TOP}}^o \to \operatorname{\mathbf{TOP}}^o$  are dual functors.

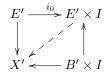

## 1.3.2 Duality of HLP and HEP

Given a homotopy lifting diagram,

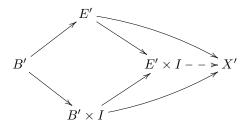

notice that  $\operatorname{Map}(X \times I, Z) = \operatorname{Map}(X, Z^I)$ , it is equivalent to

Dualize it, also by,  $\operatorname{Map}(X \times I, Z) = \operatorname{Map}(X, Z^I)$ , we have

It is equivalent to

which is the homotopy extension diagram.

# 1.3.3 Duality of Two Puppe's Sequences

Notice that  $[id] \in [\Sigma X, \Sigma X]^o$ , it induces  $\alpha_*^o[id] = \eta \colon X \to \Omega \Sigma X$ . For each map  $f \colon X \to Y$ , it induces

$$\begin{split} \eta \colon F(f) &\to \Omega C(f) \\ (x,w) &\mapsto \begin{cases} (x,2t), \ t \leq \frac{1}{2}, \\ w(2-2t), \ t \geq \frac{1}{2}, \end{cases} \end{split}$$

where  $C(f) = X \times I \sqcup Y/\{x_0\} \times I$ ,  $f(x) \sim (x,1)$  is the reduced cone of f. Then we get a diagram commutative up to homotopy.

$$\begin{array}{cccc} \Omega Y & \longrightarrow F(f) & \longrightarrow X \\ \downarrow & & \downarrow & & \downarrow \\ \Omega Y & \longrightarrow \Omega C(f) & \longrightarrow \Omega \Sigma X \end{array}$$

# 2 Homotopy Groups

# 2.1 Definitions and Properties

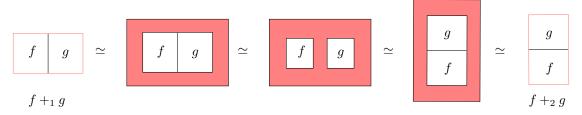

Given  $(X, x_0)$ , define *n*-th homotopy group

$$\pi_n\left(X,x_0\right) := \left[\left(I^n,\partial I^n\right),\left(X,x_0\right)\right],\,$$

where the identity element is the constant map and [f] + [g] can be represented by

$$f +_{i} g \colon (t_{1}, \dots, t_{n}) \mapsto \begin{cases} f(t_{1}, \dots, 2t_{i}, \dots, t_{n}), \ t_{i} \leq \frac{1}{2} \\ g(t_{1}, \dots, 2t_{i} - 1, \dots, t_{n}), \ t_{i} \geq \frac{1}{2} \end{cases}$$

for any i. The following picture shows that  $f +_i g$  and  $f +_j g$  are homotopy equivalent for any  $i \neq j$ , where the red parts are mapped into the base point so the homotopies work. Sometimes, we write  $\pi_n(X)$  for short.

Given a pair  $(X, A, x_0)$ ,  $J^n = \partial I^n \times I \cup I^n \times \{0\} = I^n - I^n \times \{1\} \subset I^{n+1}$ ,

define the n + 1-th relative homotopy group to be

$$\pi_{n+1}\left(X,A,x_0\right) \coloneqq \left[\left(I^{n+1},\partial I^{n+1},J^n\right),\left(X,A,x_0\right)\right].$$

Similarly, we sometimes use  $\pi_{n+1}(X, A)$  for short.

**Proposition 2.1.** When  $n \geq 2$ ,  $\pi_n(X, x_0)$  and  $\pi_{n+1}(X, A, x_0)$  are both abelian.

*Proof.* Exchanging f and g in the picture after the definition of  $\pi_n(X, x_0)$ , we can know that  $\pi_n(X, x_0)$  is abelian for  $n \geq 2$ . For the relative case, we can not process homotopy in the top red region. But for  $n \geq 3$ , the squares of f and g should be cubes, then we can place the cubes in front and behind to get new homotopy. Therefore,  $\pi_n(X, A, x_0)$  is abelian for  $n \geq 3$ .

**Theorem 2.2** (Exact Homotopy Sequence). Given a pair (X, A), we have a long exact sequence

$$\longrightarrow \pi_{n}\left(A,x_{0}\right) \xrightarrow{i_{*}} \pi_{n}\left(X,x_{0}\right) \xrightarrow{j_{*}} \pi_{n}\left(X,A,x_{0}\right) \xrightarrow{\partial} \pi_{n-1}\left(A,x_{0}\right) \longrightarrow \cdots \longrightarrow \pi_{0}\left(A,x_{0}\right) \xrightarrow{i_{*}} \pi_{0}\left(X,x_{0}\right),$$

where  $j:(X,x_0,x_0)\to (X,A,x_0)$  is the inclusion and  $\partial$  is induced from the restriction of  $I^n$  on  $I^{n-1}\times\{1\}$ .

*Proof.* Notice that each map  $f: (I^n, \partial I^n) \to (X, x_0)$  induces a map

$$\overline{f_k} \colon I^{n-k} \to \Omega^k \left( X, x_0 \right)$$

$$(u_1, \dots, u_{n-k}) \mapsto \left[ (t_1, \dots, t_k) \mapsto f \left( t_1, \dots, t_k, u_1, \dots, u_{n-k} \right) \right].$$

Then we get an isomorphism  $\pi_n\left(X,x_0\right) \to \pi_{n-k}\left(\Omega^k X,c_{x_0}\right)$ . This is because  $\pi_n\left(X,x_0\right) = \left[S^n,X\right]^o$  and  $\Sigma S^{n-1} = S^n$ , then  $\left[S^n,X\right]^o = \left[\Sigma S^{n-1},X\right]^o \cong \left[S^{n-1},\Omega X\right]^o \cong \left[S^{n-k},\Omega^k X\right]^o$  by duality (Section 1.3.1). Given a pair (X,A), the homotopy fibre of  $\iota\colon A \hookrightarrow X$  is

$$F(\iota) = \{(a, w) \in A \times X^I : w(0) = x_0, w(1) = a\} = \{w \in X^I : w(0) = x_0, w(1) \in A\} := F(X, A).$$

Each map  $f: (I^{n+1}, \partial I^{n+1}, J^n) \to (X, A, x_0)$  induces a map

$$\hat{f} \colon I^n \to F(X, A)$$
$$(t_1, \dots, t_n) \mapsto [t \mapsto f(t_1, \dots, t_n, t)],$$

induces an isomorphism  $\pi_{n+1}(X, A, x_0) \to \pi_n(F(X, A), x_0)$ .

The fibre sequence of  $\iota \colon A \hookrightarrow X$  is

$$\Omega^n F(\iota) \longrightarrow \Omega^n A \longrightarrow \Omega^n X \longrightarrow \cdots \longrightarrow F(\iota) \longrightarrow A \stackrel{\iota}{\longrightarrow} X$$
.

Appling  $[S^1,\cdot]^o$ , we have

$$[S^{1}, \Omega^{n} F(\iota)]^{o} = \pi_{1} (\Omega^{n} F(\iota)) = \pi_{n+1}(F(\iota)) = \pi_{n+2}(X, A),$$
$$[S^{1}, \Omega^{n} A]^{o} = \pi_{1} (\Omega^{n} A) = \pi_{n+1}(A),$$
$$[S^{1}, \Omega^{n} X]^{o} = \pi_{1} (\Omega^{n} X) = \pi_{n+1}(X).$$

Then we get exact sequence

$$\pi_{n+2}(X,A) \longrightarrow \pi_{n+1}(A) \longrightarrow \pi_{n+1}(X) \longrightarrow \pi_1(X) \longrightarrow \pi_1(X,A) \longrightarrow \pi_0(A) \longrightarrow \pi_0(X)$$
,

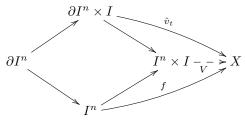

where the exactness of the last a few places is straightforward to verify.

#### 2.2 Change of Basepoint

Assume  $v: I \to X$  is a continuous path with  $v(0) = x_0$  and  $v(1) = x_1$ . We regard v as a homotopy

$$\hat{v}_t \colon I^n \to X$$
  
 $u \mapsto v(t).$ 

Note that  $\partial I^n \hookrightarrow I^n$  is a cofibration (by Corollary 1.3), by HEP, we have the following commutative diagram,

where  $[f] \in \pi_n(X, x_0)$ .

Proposition 2.3. The map

$$v_{\sharp} \colon \pi_n (X, x_0) \to \pi_n (X, x_1)$$
  
 $[v_0] \mapsto [v_1]$ 

only depends on the homotopy class of v rel  $\partial_1$  and defines an isomorphism.

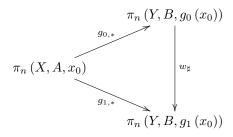

Proof. Use HEP again.

**Proposition 2.4.** Suppose  $f:(X,A) \to (Y,B)$  is a homotopy equivalence. Then  $f_*: \pi_n(X,A,x_0) \to \pi_n(Y,B,f(x_0))$  is an isomorphism.

*Proof.* We only prove that homotopic maps induce isomorphic maps on  $\pi_n$ . Assume we have a homotopy  $g_t : (X, A) \to (Y, B)$ , we get a path in Y

$$w \colon I \to Y$$
  
 $t \mapsto g_t(x_0)$ .

Then we have the following commutative diagram by HEP.

**Remark 2.5.** By the proposition, we get a right action of  $\pi_1(X, x_0)$  on  $\pi_n(X, x_0)$ .

#### 2.3 Serre Fibration

**Definition 2.6.** We say  $p: E \to B$  is a Serre fibration, if it has HLP for all cube  $I^n$ ,  $\forall n \geq 0$ .

**Theorem 2.7.** Let  $p: E \to B$  be a Serre fibration. Fix  $b_0 \in B$  and  $e_0 \in E$  such that  $p(e_0) = b_0$ . Given  $B_0 \subset B$ , write  $E_0 = p^{-1}(B_0)$ . Then  $p_*: \pi_n(E, E_0, e_0) \to \pi_n(B, B_0, b_0)$  is an isomorphism for all  $n \ge 1$ .

*Proof.* Surjectivity: Given  $h: (I^n, \partial I^n, J^{n-1}) \to (B, B_0, b_0)$ . Consider the lifting problem.

$$I^{n-1} \times \{0\} \cup \partial I^{n-1} \overset{c_{e_0}}{\times} I \xrightarrow{F} E$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow p$$

$$I^{n-1} \times I \xrightarrow{h} B$$

Notice that  $I^{n-1} \times \{0\} \cup \partial I^{n-1} \times I \cong I^{n-1} \times \{0\}\}$ , the map of the first line is  $c_{e_0}$ . Then we have the lifting  $H: I^n \to E$  such that  $H(\partial I^n) \subset E_0 = p^{-1}(B_0)$  and  $H(J^{n-1}) = e_0$ .

**Injectivity**: Assume  $p_*[f_0] = p_*(f_1]$ . We get a homotopy  $\phi_t$ :  $(I^n, \partial I^n, J^{n-1}) \to (B, B_0, b_0)$ . Consider the lifting problem.

$$I^{n} \times \partial I \cup J^{n-1} \times I \xrightarrow{\phi} E$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$I^{n} \times I \xrightarrow{\phi_{t}} B$$

Notice that  $I^n \times \partial I \cup J^{n-1} \times I \cong I^n$ , we have the lifting  $\phi$ .

Corollary 2.8. Given a Serre fibration  $F \longrightarrow E \xrightarrow{p} B$  where F is a regular fibre, we have a long exact sequence

$$\pi_n(F) \xrightarrow{i_*} \pi_n(E) \xrightarrow{p_*} \pi_n(B) \longrightarrow \pi_{n-1}(F) \longrightarrow \cdots \longrightarrow pi_0(E) \longrightarrow \pi_0(B)$$
.

*Proof.* Consider the pair (E, F). By Theorem 2.2, we have exact sequence

$$\pi_n(F) \xrightarrow{i_*} \pi_n(E) \xrightarrow{p_*} \pi_n(B) \longrightarrow \pi_{n-1}(F) \longrightarrow \cdots$$

Choose  $B_0 = b_0$  and  $F = E_{b_0}$ , we have  $\pi_n(E, F, b_0) \cong \pi_n(E, b_0, b_0) \cong \pi_n(B, b_0)$  and this corollary follows.

**Proposition 2.9.** Every fibre bundle is a Serre fibration.

*Proof.* Given the lifting problem.

$$I^{n} \times \{0\} \xrightarrow{a} E$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$I^{n} \times I \xrightarrow{b} B$$

We choose an open cover  $\{U_{\alpha}\}_{{\alpha}\in\Lambda}$  of B such that finitely many  $U_{\alpha}$ 's cover im h and over each  $U_{\alpha}$ ,  $E|_{U_{\alpha}}$  is trivialized. Choose a subdivision  $\{I_{\beta}^n\}$  of  $I^n$  and partition  $\{I_{\lambda}\}$  of I, such that  $\forall \beta, \lambda, h\left(I_{\beta}^n \times I_{\lambda}\right) \subset U_{\alpha}$  for some  $\alpha$ . Over each  $I_{\beta}^n \times I_{\lambda}$ , we consider

$$I_{\beta}^{n} \times \partial I_{\lambda} \cup \partial I_{\beta}^{n} \times I_{\lambda} \longrightarrow U_{\alpha} \times F$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$I_{\beta}^{n} \times I_{\lambda} \xrightarrow{\qquad \qquad \downarrow} U_{\alpha}$$

where  $I_{\beta}^{n} \times \partial I_{\lambda} \cup \partial I_{\beta}^{n} \times I_{\lambda} \cong I_{\beta}^{n} \times \{0\}$  and  $U_{\alpha} \times F \cong E|_{U_{\alpha}}$ . We construct the lifting of h inductively on  $\beta$  and  $\lambda$ .

#### 2.4 Higher Connectivity

**Proposition 2.10.** Let (X, A) be a pair, and  $f: (I^n, \partial I^n) \to (X, A)$  a pointed map. The followings are equivalent.

- 1. f is null-homotopic.
- 2. f is homotopic rel  $\partial I^n$  to a map in A.

*Proof.* (1)  $\Longrightarrow$  (2): Consider a surjective continuous map  $\lambda \colon I^n \times I \to I^n \times I$  such that  $\lambda|_{\partial I^n \times I} \colon (x,t) \mapsto (x,0)$  and  $\lambda|_{I^{\{0\}}} = \operatorname{id}_{I^n}$ . Consider a null-homotopy  $F \colon I^n \times I \to X$  of f, we let  $H = F \circ \lambda \colon I^n \times I \to X$ . Then H is a homotopy of f such that  $H|_{\partial I^n \times I^*} = \operatorname{id}_{\partial I^n}$  and  $H_1(I^n) \subset A$ .

Then H is a homotopy of f such that  $H|_{\partial I^n \times \{t\}} = \mathrm{id}_{\partial I^n}$  and  $H_1(I^n) \subset A$ . (2)  $\Longrightarrow$  (1): We may assume  $f(I^n) \subset A$ .  $J^{n-1}$  is a deformation retract of  $I^n$ . This is equivalent to that we get a homotopy  $h_t \colon I^n \to I^n$  such that im  $h_1 = J^{n-1}$  and  $h_0 = \mathrm{id}$ . Then  $f \circ h_t$  is a homotopy from f to  $c_{x_0}$ .

**Remark 2.11.** By (2),  $\pi_n(A, A) \to \pi_n(X, A)$  is trivial.

**Definition 2.12.** We say a pair (X, A) is n-connected if  $\pi_q(X, A) = 0$ ,  $\forall 1 \le q \le n$  and  $\pi_0(A) \to \pi_0(X)$  is surjective. Note that  $\pi_q(X, A) = 0$  is computed for all basepoints.

**Proposition 2.13.** The followings are equivalent.

- 1. (X, A) is n-connected.
- 2.  $j_*: \pi_q(A,*) \to \pi_q(X,*)$  is an isomorphism for q < n and is an epimorphism for q = n.

*Proof.* The proof follows from exact sequence of the pair (X, A) (Proposition 2.2).

**Definition 2.14.** We say  $f: X \to Y$  is n-connected if  $f_*: \pi_k(X) \to \pi_k(Y)$  is an isomorphism for  $1 \le k \le n-1$  and is an epimorphism for k=n.

**Proposition 2.15.**  $f: X \to Y$  is n-connected if and only if (Z(f), X) is n-connected.

*Proof.* The proof follows from exact sequence of the pair (Z(f), X) (Proposition 2.2) and  $Z(f) \simeq Y$ .  $\square$ 

#### 2.5 Excision and Suspension

**Theorem 2.16** (Blaskers-Massey). Let  $Y = Y_1 \cup Y_2$  be union of two open subsets and  $Y_0 = Y_1 \cap Y_2 \neq \emptyset$ . Suppose  $\pi_i(Y_1, Y_0) = 0$  for any 0 < i < p,  $p \ge 1$  and  $\pi_j(Y_2, Y_0) = 0$  for any 0 < j < q,  $q \ge 1$ . Then the map  $\iota \colon \pi_n(Y_2, Y_0) \to \pi_n(Y, Y_1)$  is an isomorphism for  $1 \le n \le p + q - 3$  and is an epimorphism for n = p + q - 2.

*Proof.* See textbook  $\S$  6.7.

**Proposition 2.17.** Let  $j: A \hookrightarrow X$  be a cofibration. Consider a push-out diagram

$$\begin{array}{ccc}
A & \xrightarrow{f} & B \\
\downarrow J & & \downarrow J \\
X & \xrightarrow{F} & Y
\end{array}$$

where  $Y = X \sqcup B/f(a) \sim j(a)$ . Suppose  $\pi_i(X,A) = 0$ ,  $\forall 0 < i < p$  and  $\pi_i(Z(f),A) = 0$ ,  $\forall 0 < i < q$ . Then the induced map  $(F,f)_*: \pi_n(X,A) \to \pi_n(Y,B)$  is an isomorphism for  $1 \le n \le p+q-3$  and is an epimorphism for n = p+q-2.

*Proof.* Replace f by a cofibration

$$A \xrightarrow{k} Z(f) \xrightarrow{p} B$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$X \xrightarrow{K} Z \xrightarrow{P} Y$$

where  $Z = Z(f) \sqcup X/(a,0) \sim j(a)$ ,  $f = p \circ k$ ,  $F = P \circ K$ . Since  $p: Z(f) \to B$  is a homotopy equivelence and  $P: Z \to Y$  is given by push-out, P is also a homotopy equivalence. Let  $Z = Z_1 \cup Z_2$  where  $Z_2 = X \sqcup A \times (\varepsilon, 1]/\sim$  and  $Z_1 = B \sqcup A \times [0, \varepsilon)/\sim$ . Then  $Z_1 \cap Z_2 = A \times (\varepsilon, 1 - \varepsilon)$ . Applying excision (Theorem 2.16),

$$\pi_n(X,A) \cong \pi_n(Z_2,Z_0) \to \pi_n(Z,Z_1) \cong \pi_n(Y,B)$$

has desired properties.

**Theorem 2.18** (Quotient). Let  $A \hookrightarrow X$  be a cofibration. Suppose  $\pi_i(CA, A) = 0$  for 0 < i < p and  $\pi_i(X, A) = 0$  for 0 < i < q. Then  $p_* : \pi_n(X, A) \to \pi_n(X/A, *)$  is an isomorphism for  $1 \le n \le p + q - 3$  and is an epimorphism for n = p + q - 2.

*Proof.* Note  $X \cup CA$  fits into the following push-out diagram.

$$\begin{array}{ccc}
A & \longrightarrow CA \\
\downarrow & & \downarrow \\
X & \longrightarrow X \cup CA
\end{array}$$

Then we get the result for

$$\pi_n(X,A) \to \pi_n(X \cup CA,CA).$$

Since  $A \hookrightarrow X$  is a cofibration,  $CA \hookrightarrow X \cup CA$  is also a cofibration. Notice that because CA is contractible,  $X \cup CA \to X \cup CA/CA$  is a homotopy equivalence (This is left as an exercise). Then

$$\pi_n(X, A) \to \pi_n(X \cup CA, CA) \cong \pi_n(X \cup CA/CA, *) \cong \pi_n(X/A, *)$$

has desired properties.

**Definition 2.19.** We say  $(X, x_0)$  is well-pointed if  $x_0 \hookrightarrow X$  is a cofibration.

**Example 2.20.** • For any CW-complex or manifold, it is well-pointed for any point.

•  $X = \left\{\frac{1}{n} : n \in \mathbb{Z}^+\right\} \cup \{0\}, x_0 = 0 \text{ is not well-pointed.}$ 

**Theorem 2.21** (Freudenthal Suspension). Let  $(X, x_0)$  be a well-pointed *n*-connected space. Then  $\Sigma_* : \pi_j(X) \to \pi_{j+1}(\Sigma X)$  is an isomorphism for  $0 \le j \le 2n$  and is an epimorphism for j = 2n + 1.

*Proof.* The suspension map is given by

$$\pi_j(X) = \left[S^j, X\right]^o \xrightarrow{\Sigma_*} \left[S^{j+1}, \Sigma X\right]^o = \pi_{j+1}(X) \ .$$

We factor  $\Sigma_*$  into

$$\Sigma_* \colon \pi_j(X) \underset{\cong}{\longleftarrow} \pi_{j+1}(CX, X)$$

$$\downarrow^{p_*}$$

$$\pi_{j+1}(\Sigma X)$$

To use Theorem 2.18, we verify  $X \hookrightarrow CX$  is a cofibration. Consider the push-out diagram

$$X \times \partial I \cup \{x_0\} \times f \longrightarrow X$$

$$\downarrow \qquad \qquad \downarrow$$

$$X \times I \longrightarrow CX$$

where  $CX = X \times I/X \times \{0\} \cup \{x_0\} \times I$ . Because  $\partial I \hookrightarrow I$  and  $x_0 \hookrightarrow X$  are cofibrations, we have  $\{x_0\} \times I \cup X \times \partial X \hookrightarrow X \times I$  is also a cofibration. By push-out diagram,  $X \hookrightarrow CX$  is a cofibration. Now we have exact sequence

$$\pi_{j}(CX, X)\pi_{j-1}(X^{\hat{\partial}}) \longrightarrow 0$$

$$\uparrow \qquad \qquad \qquad \uparrow$$

$$\pi_{j}(CX) = 0$$

$$\uparrow \qquad \qquad \qquad \uparrow$$

$$\pi_{j}(X)$$

Then (CX, X) is (n+1)-connected. And  $p_*: \pi_j(CX, X) \to \pi_j(\Sigma X)$  is isomorphism for  $j \leq 2n-1$  and is an epimorphism for j = 2n. Then we apply Theorem 2.18 with p = q = n+2 and get the desired properties for  $\Sigma_*: \pi_{j-1}(X) \to \pi_j(X)$ .

# 2.6 Computation of Homotopy Groups

Example 2.22.

$$\pi_k \left( S^n \right) \cong \begin{cases} 0, k < n \\ \mathbb{Z}, k = n \end{cases}.$$

$$\pi_1 \left( S^1 \right) \cong \mathbb{Z}, \quad \pi_1 \left( S^n \right) \cong 0, \ \forall n \ge 2.$$

To compute  $\pi_2(S^2)$ , consider the Hopf fibration

$$S^1 \longrightarrow S^2$$
.

This is given by the fibre bundle

$$S^2 = \mathbb{CP}^1 = \mathbb{C}^2 - \{0\}/\mathbb{C}^* = S^3/S^1.$$

We have the following fibre sequence

$$\pi_{2}(S^{1}) \longrightarrow \pi_{2}(S^{3}) \longrightarrow \pi_{2}(S^{2}) \xrightarrow{\partial} \pi_{1}(S^{1}) \longrightarrow \pi_{1}(S^{3})$$

$$\parallel \qquad \qquad \parallel \qquad \qquad \parallel$$

$$0 \qquad \qquad \mathbb{Z} \qquad 0$$

Because  $S^1$  is 0-connected, by Suspension Theorem,  $\pi_1\left(S^1\right) \to \pi_2\left(S^2\right)$  is an epimorphism. Then  $\pi_2\left(S^2\right) \cong \mathbb{Z}$  and  $\pi_2\left(S^3\right) = 0$ .

For  $n \geq 2$ , assume  $S^n$  is (n-1)-connected, by Freudenthal's Suspension,  $\pi_j(S^n) \to \pi_{j+1}(S^{n+1})$  is an isomorphism for  $j \leq n \leq 2n$ . By induction,  $\pi_n(S^n) \cong \mathbb{Z}$  and  $\pi_j(S^n) = 0$  for j < n.

#### Example 2.23. Notice that

$$\mathbb{CP}^n = \mathbb{C}^{n+1} - \{0\}/\mathbb{C}^* = S^{2n+1}/U(1)$$

for  $n \geq 2$ , we get a fibre bundle

$$U(1) \hookrightarrow S^{2n+1} \longrightarrow \mathbb{CP}^n$$
.

Then we have fibre sequence

$$\pi_j\left(S^{2n+1}\right) \longrightarrow \pi_j\left(\mathbb{CP}^n\right) \pi_{j-1}(U(1)) \longrightarrow \pi_{j-1}\left(S^{2n+1}\right).$$

Then when  $j=2, \, \pi_2\left(\mathbb{CP}^n\right)\cong\mathbb{Z}$ . When  $2\neq j\leq 2n, \, \pi_j\left(\mathbb{CP}^n\right)=0$ . Consider  $\mathbb{CP}^{\infty}=\bigcup_{n\geq 1}\mathbb{CP}^n,$ 

$$\begin{array}{cccc}
\mathbb{CP}^n & \mathbb{CP}^{n+1} \\
\uparrow & & \uparrow \\
S^{2n+1} & \mathbb{S}^{2n+3} \\
\downarrow & & \downarrow \\
U(1) & U(1)
\end{array}$$

is induced from Five-Lemma. Then  $i_*: \pi_2\left(\mathbb{CP}^n\right) \to \pi_2\left(\mathbb{CP}^{n+1}\right)$  is an isomorphism. As conclusion,

$$\pi_n\left(\mathbb{CP}^\infty\right) \cong \begin{cases} \mathbb{Z}, & n=2\\ 0, & n\neq 2. \end{cases}$$

Example 2.24. We have the following fibre bundle by transitive group action.

$$O(n) \xrightarrow{j} O(n+1) \longrightarrow S^n$$
.

Since  $S^n$  is (n-1)-connected, the homotopy exact sequence for fibrations show  $j \colon \mathcal{O}(n) \hookrightarrow \mathcal{O}(n+1)$  is (n-1)-connected.

Write 
$$O(\infty) = \bigcup_{n=1}^{\infty} O(n)$$
.

Theorem 2.25 (Bott-Periodicity).

$$\pi_k(\mathcal{O}(\infty)) \cong \pi_{k+8}(\mathcal{O}(\infty)).$$

**Example 2.26** (Stiefel Manifolds). Denote  $V_k(\mathbb{R}^n)$  be the orthogonal k-frames in  $\mathbb{R}^n$ . Then we have

$$V_k(\mathbb{R}^n) = O(n)/O(n-k).$$

Then we get a fibration

$$O(n-k) \hookrightarrow O(n) \longrightarrow V_k(\mathbb{R}^n)$$
.

Notice that in

$$O(n-k)$$
  $O(n > k+1)$   $O(n)$ ,

j is (n-k-1)-connected, then

$$\pi_i(\mathcal{O}(n-k)) \xrightarrow{\cong} \pi_i(\mathcal{O}(n)) \longrightarrow \pi_i(\mathcal{V}_k(\mathbb{R}^n))$$

for  $i \leq n-k-2$ . Therefore,  $\pi_i\left(\mathbf{V}_k\left(\mathbb{R}^n\right)\right) = 0$  when  $i \leq n-k-1$ .

Claim 9.  $V_k(\mathbb{R}^n)$  is (n-k-1)-connected.

Consider the projection

$$p \colon V_{k+1}\left(\mathbb{R}^{n+1}\right) \to V_1\left(\mathbb{R}^{n+1}\right) \cong S^n$$
$$(v_1, \dots, v_{k+1}) \mapsto v_{k+1}.$$

The fibre is  $V_k(\mathbb{R}^n)$ . We know  $S^n$  is (n-1)-connected, then  $j \colon V_k(\mathbb{R}^n) \to V_{k+1}(\mathbb{R}^{n+1})$  is (n-1)-connected. Therefore, we have  $\pi_{n-k}(V_k(\mathbb{R}^n)) \cong \pi_{n-k}(V_2(\mathbb{R}^{n-k+2}))$ . We know that  $\pi_1(V_2(\mathbb{R}^{n-k+2})) = 0$ . By Hurewicz Theorem,  $H_i(V_2(\mathbb{R}^{n-k+2})) \cong \pi_i(V_2(\mathbb{R}^{n-k+2}))$  for  $2 \le i \le n-k$ , which is non-trivial. We will do these calculations later.

## Part II

# Generalized Homology

# 3 Homology Theory and CW-Complexes

# 3.1 Homology Theory

Denote  $R - \mathbf{MOD}$  be the category of left R-modules and  $\mathbf{TOP}(2)$  be the category of pairs (X, A) and

$$k \colon \mathbf{TOP}(2) \to \mathbf{TOP}(2)$$
  
 $(X, A) \mapsto (A, \varnothing)$ 

be the forgetful functor.

**Definition 3.1** (Eilenberg-Steenrod Axioms). A homology theory on **TOP**(2) consists

- 1. a family of functors  $h_n : \mathbf{TOP}(2) \to R \mathbf{MOD}$ ,
- 2. a family of natural transformations  $\partial_n : h_n \to h_{n-1} \circ k$  such that
  - (a) Homotopy invariance:  $h_n(f_0) = h_n(f_1)$  for  $f_0 \simeq f_1$ .
  - (b) Exact sequence:

$$\cdots \longrightarrow h_{n+1}(X,A) \xrightarrow{\partial_{n+1}} h_n(A) \longrightarrow h_n(X) \longrightarrow h_n(X,A) \longrightarrow \cdots$$

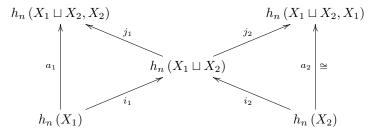

for any pair (X, A).

(c) Excison: Given a pair (X, A), for any  $U \subset A$  such that  $\overline{U} \subset \text{Int}(A)$ , then inclusion induces an isomorphism  $h_n(X - U, A - U) \to h_n(X, A)$ .

**Proposition 3.2.** Given two pairs  $(X_i, A_i)$ , i = 1, 2, we get an isomorphism

$$\bigoplus_{i=1}^{2} h_n\left(X_i,A_i\right) \to h_n\left(X_1 \sqcup X_2,A_1 \sqcup A_2\right).$$

*Proof.* Consider the commutative diagram for  $A_i = \emptyset$ .

Injectivity of  $i_1 \oplus i_2$  is easy to check. For its surjectivity, take  $c \in h_n(X_1 \sqcup X_2)$ , we have  $j_1(c) = j_1 \circ i_1 \circ a_1^{-1}(j_1(c))$ . Then  $c - i_1 \circ a_1^{-1}(j_1(c)) \in \ker j_1$ . Therefore, there exists  $x \in h_n(X_2)$  such that  $i_2(x) = c - i_1(a_1^{-1} \circ j_1(c))$ . Then  $c = i_1(y) + i_2(x)$  where  $y = a_1^{-1} \circ j_1(c) \in h_n(X_1)$ .

The general case will be proved later.

Let A = \* be a single point. Define  $\widetilde{h}(X) := h(X, *)$ .

Assume there is a map  $r: X \to A$  such that  $r \circ i \simeq id$ . Then  $i_*: h_n(A) \to h_n(X)$  is injective. We get short exact sequences

$$0 \longrightarrow h_n(A) \xrightarrow{i_*} h_n(X) \longrightarrow h_n(X,A) \longrightarrow 0.$$

Then we have splitting  $h_n(X) \cong h_n(A) \oplus h_n(X,A)$  and  $h_n(X,A) = \ker r_*$ . When A = \*, take  $r = c \colon X \to *$ , then  $\widetilde{h_n}(X) = h_n(X,*) = \ker (c_* \colon h_n(X) \to h_n(*))$ .

**Proposition 3.3.** Let  $A \hookrightarrow X$  be a cofibration. Then the quotient map induces an isomorphism  $j_*: h_n(X,A) \to h_n(X/A,*)$ .

*Proof.* Apply excision to  $(X \cup CA, CA)$  for U = the cone point of CA, we have  $h_n(X, A) \cong h_n(X \cup CA, CA)$ . When  $A \hookrightarrow X$  is a cofibration,  $CA \hookrightarrow X \cup CA$  is a cofibre. Since CA is contractible,  $X \cup CA/CA \cong X \cup CA$ . Then  $h_n(X \cup CA, CA) \cong h_n(X/A, *)$ .

**Proposition 3.4.** Let (X,\*) and (Y,\*) be well-pointed spaces and  $f: X \to Y$  is a pointed map. Then the cofibre sequence  $X \xrightarrow{f} Y \xrightarrow{f^1} C(f)$  induces an exact sequence

$$\widetilde{h_n}(X) \xrightarrow{f_*} \widetilde{h_n}(Y) \xrightarrow{f_*^1} \widetilde{h_n}(C(f))$$
.

*Proof.* The proof follows the commutative diagrams

$$\widetilde{h_n}(X) \longrightarrow \widetilde{h_n}(Z(f)) \longrightarrow \widetilde{h_n}(Z(f), X)$$

$$\cong \bigvee_{\cong} \bigvee_{\cong} \bigvee_{\cong} \bigvee_{\cong} \bigvee_{\widetilde{h_n}(X) \longrightarrow \widetilde{h_n}(Y) \longrightarrow \widetilde{h_n}(C(f))}$$

and

$$\begin{array}{c} X \times \partial I \xrightarrow{(\mathrm{id},f)} X \sqcup Y \\ \downarrow & \downarrow \\ X \times I \longrightarrow Z(f) \end{array}$$

**Proposition 3.5.** Given a triple (X, A, B). Assume  $B \hookrightarrow X$  is a cofibration, we get an exact sequence

$$\cdots \longrightarrow h_n(A,B) \longrightarrow h_n(X,B) \longrightarrow h_n(X,A) \xrightarrow{\partial} h_{n-1}(A,B) \longrightarrow \cdots$$

*Proof.* Applying excision, we know that (X, A, B) and  $(X \cup CB, A \cup CB, CB)$  have the same sequence. Applying homotopy equivalence,  $(X \cup CB, A \cup CB, CB)$  and (X, A, \*) have the same sequence. The triple sequence of (X, A, \*) is the reduced pair sequence of (X, A).

#### 3.1.1 Suspension Isomorphism

Given a pair (X, A), we have the suspension isomorphism

$$\sigma: h_n(X, A) \to h_n(\partial I \times X \cup I \times A, \{0\} \times X \cup I \times A)$$

by excision for  $U=(0,1]\times A\cup\{0\}\times X$ . Consider the boundary map  $\partial_{n+1}\colon h_{n+1}(I\times X,\partial I\times X\cup I\times A)\to h_n(\partial I\times X\cup I\times A,\{0\}\times X\cup I\times A)$ . Notice that  $X\simeq I\times X\simeq\{0\}\times X\cup I\times A$ , we have the exact sequence

$$h_{n+1}(I\times X,\partial I\times X\cup I\times A)\xrightarrow{\partial_{n+1}}h_n(\partial I\times X\cup I\times A,\{0\}\times X\cup I\times A)\xrightarrow{}h_n(I\times X,\{0\}\times X\cup I\times A)=0\ .$$

Then  $\partial_{n+1}$  is an isomorphism and so is  $\partial_{n+1}^{-1}$ . We get isomorphisms

$$h_n(x,A) \longrightarrow h_n(\partial I \times X \cup I \times A, \{0\} \times X \cup I \times A)^{-1} \longrightarrow h_{n+1}((I,\partial I) \times (X,A))$$
.

Choose A = \*, define the suspension isomorphism by

$$h_n(X, *) \longrightarrow h_{n+1}^{\sigma}(X \times I, \partial I \times X \cup I \times *)$$

$$\cong \bigvee_{\text{quotient}} \bigvee_{\text{quotient}} (\Sigma X)$$

Assume (X,\*) is well-pointed, by Hurwicz map, we have the commutative diagram

$$\pi_n(X) \xrightarrow{\Sigma_*} \pi_n(\Sigma X)$$

$$\downarrow \qquad \qquad \downarrow$$

$$\widetilde{h_n}(X) \xrightarrow{\widetilde{\sigma}} \widetilde{h_{n+1}}(X)$$

### 3.2 CW-Complex

**Definition 3.6.** We say X is obtained from A by attaching an n-cell if there exists a push-out diagram

$$S^{n-1} \xrightarrow{\varphi} A$$

$$\downarrow \qquad \qquad \downarrow$$

$$D^n \xrightarrow{\Phi} X$$

where  $\varphi$  is called attaching map and  $\Phi$  is called characteristic map.

A CW-decomposition of (X, A) is a filtration  $A = X^{-1} \subset X^0 \subset \cdots \subset X$  such that

- 1.  $X = \bigcup_{n \ge -1} X^n$ ,
- 2.  $X^n$  is obtained from  $X^{n-1}$  by attaching n-cells,
- 3. X carries the colimit topology (weak topology).

**Proposition 3.7.** Let (Y, B) be an n-connected pair, (X, A) be a relative CW-complex of dimension  $\leq n$ . Then each map  $(F, f): (X, A) \to (Y, B)$  is homotopic rel. A to a map into B. When dimension < n, the homotopy class rel. A of maps  $X \to B$  is unique.

Proof. Consider

$$\bigsqcup_{k} S_{k}^{q-1} \longrightarrow A \longrightarrow B$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$\bigsqcup_{k} D_{k}^{q} \xrightarrow{\Phi^{q}} X^{q} \xrightarrow{F^{q}} Y$$

For any  $q \leq n$ ,  $\pi_q(Y, B) = 0$ . Then  $F^q \circ \Phi^q$  can be homotoped into B rel.  $\bigsqcup_k S_k^{q-1}$ .

$$\bigsqcup_{k} S_{k}^{q-1} \longrightarrow A \longrightarrow B$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$\bigsqcup_{k} D_{k}^{q} \xrightarrow{\Phi^{q}} X^{q} \xrightarrow{F^{q}} Y$$

When dimension of (X,A) < n, apply the argument to  $(X \times I, X \times \partial I \cup A \times I)$  which is a relative CW-complex of dimension < n + 1.

**Theorem 3.8.** Suppose  $h: B \to Y$  is n-connected. Then for a CW-complex  $X, h_*: [X, B] \to [X, Y]$  is bijective when dim X < n and surjective when dim X = n.

*Proof.* We map replace Y by Z(h):  $B \longrightarrow Z(h) \xrightarrow{\cong} Y$ .

**Surjectivity**: Let  $A = \emptyset$ . Apply Proposition 3.7 to  $(X, \emptyset) \to (Z(h), B)$ .

**Injectivity**: Apply Proposition 3.7 to  $(X \times I, X \times \partial I)$ .

**Theorem 3.9** (Whitehead). Let  $f: Y \to Z$  be a map between CW-complexes with dim Y, dim  $Z \le n \le \infty$ . If  $f_*: \pi_q(Y) \to \pi_q(Z)$  is an isomorphism for  $0 \le q \le n$ , then f is a homotopy equivalence.

*Proof.* The map  $f: Y \to Z$  is n-connected. By Theorem 3.8,  $f_*: [Z,Y] \to [Z,Z]$  is surjective. Then there exists  $g: Z \to Y$  such that  $f \circ g \simeq \operatorname{id}_Z$  and g is n-connected. Use Theorem 3.8 again, there exists  $h: Y \to Z$  such that  $g \circ h \simeq \operatorname{id}_Y$ . Therefore, g is a homotopy equivalence.

**Theorem 3.10** (Suspension Theorem). Suppose Y is n-connected and X is a CW-complex. Then  $\Sigma_*: [X,Y]^o \to [\Sigma X, \Sigma Y]^o$  is bijective if dim  $X \leq 2n$  and is surjective if dim X = 2n + 1.

*Proof.* We know that  $[\Sigma X, \Sigma Y]^o \cong [X, \Omega \Sigma Y]^o$ . By Freudethal's Suspension Theorem,  $\Sigma_*$ :  $[S^k, Y]^o \to [S^{k-1}, \Sigma Y]^o$  is an isomorphism when  $k \leq 2n$  and epimorphism if k = 2n + 1. Notice that  $\pi_{k+1}(\Sigma Y) \cong \pi_k(\Omega \Sigma Y)$ ,  $\sigma_*$ :  $[S^k, Y]^o \to [S^k, \Omega \Sigma Y]^o$  is adjoint to  $\Sigma_*$  and is reduced from

$$\begin{split} \sigma\colon Y &\to \Omega \Sigma Y \\ y &\mapsto [t \mapsto (y,t)]. \end{split}$$

Therefore,  $\sigma$  is (2n+1)-connected. Apply Theorem 3.8 to  $\sigma_*: [X,Y]^o \to [X,\Omega\Sigma Y]^o$ .

## 3.3 CW-Approximation

**Proposition 3.11.** Suppose X is obtained from A by attaching (n+1)-cell. Then (X, A) is n-connected. *Proof.* Consider the push-out diagram

$$S^n \longrightarrow A$$

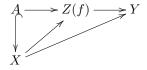

$$\downarrow \qquad \qquad \downarrow$$

$$D^{n+1} \longrightarrow X$$

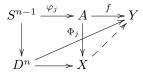

The Excision Theorem of push-out shows that  $\pi_0(X, A) = 0$  and  $\pi_q(D^{n+1}, S^n) = 0$  for any  $1 \le q \le n$ . Then  $(\Phi, \varphi) \colon (D^{n+1}, S^n) \to (X, A)$  is (n-1)-connected. When  $k \le n-1$ ,  $0 = \pi_k(D^{n+1}, S^n) \to \pi_n(X, A)$  is an isomorphism.

**Theorem 3.12.** Let  $f: A \to Y$  be a k-connected map. Then for each n > k, there exists a relative CW-complex (X, A) with cells in dim  $\in \{k + 1, \dots, n\}$  and an n-connected extension  $F: X \to Y$  of f.

*Proof.* When  $n=1,\ k=0$ , the proof is trivial. Consider  $k=n-1,\ n\geq 2$ . Assume  $f\colon A\to Y$  is (n-1)-connected. Replace Y by Z(f):

Assume  $f: A \to Y$  is an inclusion. Let  $(\Phi_j, \varphi_j): (D^n, S^{n-1}) \to (Y, A)$  be a set of generators of  $\pi_n(Y, A)$ . Attach n-cells on A using  $\varphi_j$ . Regard  $\Phi_j$  as a null-homotopy of  $f \circ \varphi_j$ . F is obtained by push-out property.

And then  $F_*: \pi_n(X, A) \to \pi_n(Y, A)$  is an epimorphism. Chosider the diagram

$$\pi_{n}(A) \longrightarrow \pi_{n}(X) \longrightarrow \pi_{n}(X, A) \longrightarrow \pi_{n-1}(A) \longrightarrow \pi_{n-1}(X) \longrightarrow 0$$

$$\downarrow \cong \qquad \qquad \downarrow F_{*} \qquad \qquad \downarrow$$

Notice that  $F_*: \pi_n(X) \to \pi_n(Y)$  is also an epimorphism. Then by chasing diagram, we know that  $F_*: \pi_{n-1}(X) \to \pi_{n-1}(Y)$  is an isomorphism.

**Corollary 3.13.** Given any space Y, there exists a CW-complex X and a map  $F: X \to Y$  such that  $F_*: \pi_n(X) \to \pi_n(Y)$  is an isomorphism for any  $n \ge 0$ . Such X is called a CW-approximation of Y.

**Theorem 3.14.** Let Y be a k-connected CW-complex. Then there exists a CW-complex X such that

- 1. X is homotopy equivalent to Y;
- 2.  $X^k = \{*\}.$

*Proof.* Apply Theorem3.12 to  $A = \{*\} \hookrightarrow Y$  which is a k-connected map.

## 3.4 Eilenberg-MacLane Space

#### 3.4.1 Remarks about Compactly Generated Spaces

**Definition 3.15.** A Hausdorff space X is said to be compactly generated if for any compact subset K, a subset  $A \subset X$  satisfies  $A \cap K$  is closed, then A is closed in X.

**Example 3.16.** There spaces are compactly generated spaces:

- locally compact Hausdorff spaces,
- metric spaces,
- CW-complexes with finite cells in each dimension.

Given a Hausdorff space X, we can put a new topology  $\mathcal{T}$  on X by imposing:

$$A \subset X$$
 is  $\mathcal{T}$ -closed  $\iff A \cap K$  is closed for any compact subset  $K \subset X$ 

such that X is compactly generated under  $\mathcal{T}$ .

Fact 3.17. If X, Y are both compactly generated spaces, then  $X \times Y$  needs not to be compactly generated.

**Definition 3.18.** We denote by  $X \times_k Y$  the product with compactly generated topology. We denote by kF(X,Y) the space of continuous maps from X to Y, equipped the compactly generated topology.

**Theorem 3.19.** Let X, Y, Z be compactly generated spaces. Then

1. The evaluation map

$$kF(Y,Z) \times_k Y \to Z$$
  
 $(f,g) \mapsto f(g)$ 

is continuous.

#### 2. The adjoint map

$$kF(X, kF(Y, Z)) \rightarrow kF(X \times_k Y, Z)$$

is a homeomorphism.

**Proposition 3.20.** Suppose  $\pi_j(Y) = 0$  for j > n. Let X be obtained from A by attaching cells of  $\dim \geq n + 2$ . Then  $\iota_* \colon [X,Y] \to [A,Y]$  is a bijection.

*Proof.* Surjectivity: Given  $f: A \to Y$  and attaching map  $\varphi: S^k \to A, k \ge n+1$ . Then  $f \circ \varphi: S^k \to Y$  is null-homotopic which can be extended over X.

**Injectivity**: Apply the argument to  $(X \times I, X \times \partial I \cup A \times I)$ .

**Definition 3.21.** Let  $\pi$  be an abelian group. An Eilenberg-MacLane space of type  $K(\pi, n)$  is a CW-complex such that

$$\pi_j(X) = \begin{cases} \pi, & i = j; \\ 0, & n \neq j. \end{cases}$$

**Proposition 3.22.** Suppose  $X_1, X_2$  are (n-1)-connected CW-complex with  $n \geq 2$ . Then

$$\pi_n(X_1) \oplus \pi_n(X_2) \to \pi_n(X_1 \vee X_2)$$

is an isomorphism.

*Proof.* We can assume  $X_i^{n-1} = \{*\}$  by CW-approximation. Therefore, cells in  $X_1 \times X_2$  have dimension  $0, n, \geq 2n$ . Then  $X_1 \times X_2$  is obtained from  $X_1 \vee X_2$  by attaching cells of dim  $\geq 2n$ . We have  $\pi_n(X_1 \vee X_2) \to \pi_n(X_1 \times X_2) = \pi_n(X_1) \oplus \pi_n(X_2)$  is an isomorphism.

**Theorem 3.23.** Let X be a (n-1)-connected CW-complex. Suppose Y satisfies  $\pi_j(Y) = 0, \forall j > n \geq 2$ . Then the map  $h_* \colon [X,Y]^o \to \operatorname{Hom}(\pi_n(X),\pi_n(Y))$  is a bijection.

Proof. We can assume  $X^{n-1} = \{*\}$  by Proposition 3.20. Then  $[X,Y]^o = [X^{n+1},Y]^o$ . Notice that  $\pi_n\left(X^{n+1}\right) = \pi_n(X)$ , we only need to prove  $h_X \colon \left[X^{n+1},Y\right]^o \to \operatorname{Hom}\left(\pi_n\left(X^{n+1}\right),\pi_n(Y)\right)$  is a bijection. We know  $X^n = \bigvee_j S_j^n \coloneqq B$ . Applying homotopy, we may assume all attaching maps of (n+1)-cells are cased. Then  $X^{n+1}$  is the mapping cone  $f \colon A \coloneqq \bigvee_k S_k^n \to \bigvee_j S_j^n = B$ .

We have the cofibre sequence

$$[A,Y]^o \longleftarrow [B,Y]^o \longleftarrow \left[X^{n+1},Y\right]^o \longleftarrow \left[\Sigma A,Y\right]^o \longleftarrow \cdots$$

Notice that

$$[\Sigma A, Y]^o = \left[\Sigma \bigvee_k S_k^n, Y\right]^o = \left[\bigvee_k \Sigma S_k^n, Y\right]^o = \left[\bigvee_k S_k^{n+1}, Y\right]^o = 0$$

because  $[h] = \sum_{k} [h_k]$  and  $\pi_{n+1}(Y) = 0$ .

Claim 10.

$$\pi_n(A) \xrightarrow{f_*} \pi_n(B) \longrightarrow \pi_n(X^{n+1}) \longrightarrow 0$$

is exact.

*Proof of Claim.* Consider the push-out diagram:

$$\begin{array}{ccc}
A & \xrightarrow{f} & B \\
\downarrow & & \downarrow \\
CA & \xrightarrow{} & X^{n+1}
\end{array}$$

We know

$$\pi_m(A) \longrightarrow \pi_m(CA) \longrightarrow \pi_m(CA, A) \xrightarrow{\cong} \pi_{m-1}(A) \longrightarrow 0$$

Then  $\pi_m(CA, A) = 0$  for any  $m \le n$ . We know f is (n-1)-connected. Applying excision,  $\pi_m(CA, A) \to \pi_m(X^{n+1}, B)$  is an isomorphism for  $m \le 2n - 1$ . We have an exact sequence

$$\pi_m(B) \longrightarrow \pi_m\left(X^{n+1}\right) \longrightarrow \pi_m\left(X^{n+1}, B\right) \longrightarrow \pi_{m-1}(B)0$$

when  $m \leq n$ . Then

$$\pi_{n+1}(CA, A) \xrightarrow{\text{excision}} \pi_{n+1} \left( X^{n+1}, B \right) \longrightarrow \pi_n(B) \longrightarrow \pi_n(X) \longrightarrow 0$$

$$\downarrow \cong \qquad \qquad \downarrow \pi_n(A)$$

Apply  $\operatorname{Hom}(-, \pi_n(Y))$ , we get an exact sequence

Claim 11.  $h_A$  and  $h_B$  are bijections.

Proof of Claim. We have

$$\operatorname{Hom}\left(\pi_{n}(A), \pi_{n}(Y)\right) = \operatorname{Hom}\left(\pi_{n}\left(\bigvee_{j} S_{j}^{n}\right), \pi_{n}\left(Y\right)\right) = \operatorname{Hom}\left(\bigoplus_{j} \pi_{n}\left(S_{j}^{n}\right), \pi_{n}\left(Y\right)\right)$$
$$= \prod_{j} \operatorname{Hom}\left(\pi_{n}\left(S_{j}^{n}\right), \pi_{n}\left(Y\right)\right) \cong \prod_{j} \pi_{n}(Y)$$

and

$$[A,Y]^o = \left[\bigvee_j S_j^n,Y\right]^o = \prod_j \left[S_j^n,Y\right]^o = \prod_j \pi_n(Y).$$

Finally, by claim that  $\left[X^{n+1},Y\right]^o \to [B,Y]^o$  is injective, we get our conclusion by something like Five Lemma.

**Theorem 3.24.** Let  $\pi$  be an abelian group and  $n \geq 2$ . Then the Eilenberg-MacLane space  $K(\pi, n)$  exists and is unique up to homotopy.

*Proof.* Uniqueness: Assume X, Y are both  $K(\pi, n)$ . Then by Theorem 3.23,

$$h_X : [X, Y]^o \to \operatorname{Hom}(\pi_n(X), \pi_n(Y)) = \operatorname{Hom}(\pi, \pi)$$

is a bijection. Choose  $f: X \to Y$  such that  $h_X([f]) = \mathrm{id}$ . Then f is a weak homotopy equivalence. Whitehead Theorem gives us that f is in fact a homotopy equivalence.

Existence: Consider a free resolution

$$F_1 \longrightarrow F_0 \longrightarrow \pi \longrightarrow 0$$

with relators  $F_1$  and generators  $F_0$ . Construct  $X^{n+1}$  as the mapping cone of  $g\colon F_1\hookrightarrow\bigvee_k S_k^n\to\bigvee_j S_j^n \hookleftarrow F_0$ . Therefore,  $X^{n+1}$  is (n+1)-connected and  $\pi_n\left(X^{n+1}\right)=\pi$ . We attach cells of dim  $\geq n+2$  to eliminate  $\pi_m(X)$  for  $m\geq n+1$ , by Zorn's Lemma, we finish our construction.

**Definition 3.25.**  $K(\pi,0) := \pi$  equipped with discrete topology.  $K(\pi,1)$  is constructed similar to Theorem 3.24, but the uniqueness will be proved later.

## 3.5 Spectral Homology

In this section, we assume that  $\pi$  is finitely generated and X is compactly generated.

**Definition 3.26.** A spectrum is a sequence of pairs  $\{(E_n, e_n)\}_{n\geq 0}$  where E(n) is a pointed space,  $e_n \colon \Sigma E(n) \to E(n+1)$  is a pointed map. We say a spectrum is an  $\Omega$ -spectrum if  $\varepsilon_n \colon E(n) \to \Omega E(n+1)$  is a homotopy equivalence, where  $\varepsilon_n$  is the adjoint of  $e_n$ .

**Example 3.27.** 1. Sphere Spectrum:  $E(n) = S^n$ ,  $e_n : \Sigma S^n \to S^{n+1}$  is the identity map

$$\Sigma S^n = S^n \wedge S^1 \cong S^{n+1}$$
$$\mathbb{R}^{n+1} \times I \hookrightarrow \mathbb{R}^{n+2}.$$

- 2. Eilenberg-MacLane Spectrum: Fix an abelian group  $\pi$ . Let  $E(n) = K(\pi, n)$ . Construct  $e_n : \Sigma K(\pi, n) \to K(\pi, n + 1)$  as follows:
  - (a) Milnor:  $\Omega K(\pi, n+1)$  is a CW-complex. Then  $\left[S^k, \Omega K(\pi, n+1)\right]^o = \left[S^{k+1}, K(\pi, n+1)\right]^o$  and then  $\Omega K(\pi, n+1) \cong K(\pi, n)$ . Define  $e_n \colon \Sigma K(\pi, n) \to K(\pi, n+1)$  as the adjoint map; or
  - (b) Notice that  $\pi_k(\Sigma K(\pi, n)) = \begin{cases} 0, & k \leq n \\ \pi, & k = n + 1 \end{cases}$  because  $\pi_k(K(\pi, n)) \to \pi_{k+1}(\Sigma K(\pi, n))$  is an isomorphism when  $k \leq 2n 2$ . Then  $K(\pi, n + 1)$  is obtained from  $\Sigma K(\pi, n)$  by attaching cells of dim  $\geq n + 3$ . Take  $e_n : \Sigma K(\pi, n) \to K(\pi, n + 1)$  to be the inclusion map.

**Definition 3.28.** A reduced homology theory consists of a family of functors  $\widetilde{h}_n \colon \mathbf{TOP}^o \to R - \mathbf{MOD}$  and isomorphisms  $\sigma_n \colon \widetilde{h}_n \to \widetilde{h}_{n+1} \circ \Sigma$  that satisfy

- 1. Homotopy invariance:  $\widetilde{h}_n(f_0) = \widetilde{h}_n(f_1)$  if  $f_0 \simeq f_1$ .
- 2. Exactness: each cofibre sequence

$$X \xrightarrow{f} Y \xrightarrow{f'} C(f)$$

induces an exact sequence

$$\widetilde{h}_*(X) \longrightarrow \widetilde{h}_*(Y) \longrightarrow \widetilde{h}_*(C(f)) \ .$$

**Remark 3.29.** Unreduced theory  $\iff$  reduced theory. To see that, define  $h_n(X) = \widetilde{h}_n(X \sqcup \{*\})$  and  $h_n(X,A) = \widetilde{h}_n(C(X,A))$ .

Let  $E = \{(E(n), e_n)\}$  be a spectrum. We get suspension maps

$$\left[S^{n+k}, E(n) \wedge X\right]^o = \pi_{n+k}(E(n) \wedge X) \to \pi_{n+k+1}(E(n+1) \wedge X) = \left[S^{n+k+1}, E(n+1) \wedge X\right]^o$$

and

$$\Sigma(E(n) \wedge X) = S^1 \wedge (E(n) \wedge X) = \Sigma E(n) \wedge X.$$

Define  $E_n(X) := \operatorname{colim}_{k \to \infty} \pi_{n+k}(E(k) \wedge X)$ , and  $\sigma_n : E_n(X) \to E_{n+1}(\Sigma X)$  is defined via  $[S^{n+k}, E(n) \wedge X] \to [S^{n+k+1}, E(n) \wedge \Sigma X]$ .

**Theorem 3.30.**  $\{(E_n(X), \sigma_n)\}$  defines a reduced homology theory.

*Proof.* Homotopy invariance is by definitions.

**Injectivity of**  $\sigma_n$ : Suppose  $x \in \ker \sigma_n$ , there exists  $[f] \in [S^{n+k}, E(k) \wedge X]^o$  such that [f] represents x and  $f \wedge \operatorname{id}_{S^1} : S^{n+k} \wedge S^1 \to (E(k) \wedge X) \wedge S^1$  is null-homotopic. Then

$$S^{n+k} \wedge S^1 \xrightarrow{f \wedge \mathrm{id}} E(k) \wedge \Sigma X \xrightarrow{e_k \wedge \mathrm{id}} E(k+1) \wedge X$$

is null-homotopic. Note that  $[(e_k \wedge id) \circ (f \wedge id)]$  represents x as well. We must have x = 0. Surjectivity of  $\sigma_n$ : Given  $g: S^{n+k+1} \to E(k) \wedge X \wedge S^1$ . Then define

$$f \colon \mathrel{S^{n+k+1}} \stackrel{g}{-\!\!\!-\!\!\!-\!\!\!-} E(k) \wedge X \wedge S^1 \stackrel{e_k}{-\!\!\!\!-\!\!\!\!-\!\!\!\!-} E(k+1) \wedge X$$

and we have  $\sigma_n([f]) = [g]$ .

Exactness of Cofibre Sequence: Consider

$$E_n(X) \xrightarrow{f_n} E_n(Y) \xrightarrow{f'_n} E_n(C(f))$$
.

Suppose  $z \in \ker f'_n$  and write  $h: S^{n+k} \to E(k) \wedge Y$  to represent z. Then  $(\operatorname{id}_{E(k)} \wedge f') \circ h: S^{n+k} \to E(k) \wedge C(f)$  is null-homotopic. Consider cofibre sequences:

$$S^{n+k} \longrightarrow C(\mathrm{id}) \longrightarrow S^{n+k} \wedge S^1 \longrightarrow S^{n+k} \wedge S^1$$

$$\downarrow h \qquad \downarrow \beta \qquad \downarrow h \wedge \mathrm{id} \wedge \mathrm{id} \qquad \downarrow h \wedge \mathrm{id} \wedge \mathrm{id} \qquad \downarrow h \wedge \mathrm{id} \wedge \mathrm{id}$$

where H is given by null-homotopy of  $(id \land f') \circ h$  and  $\beta$  is the quotient of H and the first two squares are commutative. These indece  $h \land id$  such that the last square is commutative up to homotopy. Therefore, under  $\operatorname{colim}_{k \to \infty}$ , we have

$$f_*[\beta] = [(\mathrm{id} \wedge f) \circ \beta] = [h \wedge \mathrm{id}] = [h].$$

Remark 3.31. In Example 3.27,

1. When  $E = \{(S^n, \Sigma)\}_{n > 0}$ ,

$$E_n(X) = \operatorname{colim}_{k \to \infty} \pi_{n+k} \left( S^k \wedge X \right) = \operatorname{colim}_{k \to \infty} \pi_{n+k} \left( \Sigma^k X \right) = \pi_n^s(X),$$

which is the stable homotopy group.

2. When  $E = \{(K(\mathbb{Z}, n), \sigma_n)\}_{n \ge 0}$ ,

$$E_n(X) = \operatorname{colim}_{k \to \infty} \pi_{n+k} \left( K(\mathbb{Z}, n) \wedge X \right) \cong \widetilde{H}_n(X, \mathbb{Z}),$$

which is the reduced singular homology.

**Theorem 3.32** (Brown's Representation Theory). Let  $\{(h_n, \partial_n)\}$  be a homology theory. Then there exists a sectrum  $E = \{(E(n), e_n)\}$  and natural isomorphisms  $h_n(X, A) \cong \operatorname{colim}_{k \to \infty} \pi_{n+k} (E(k) \wedge (X^+/A^+))$  for all finite CW-complexes (X, A), where  $X^+ = X \sqcup \{*\}$  and  $A^+ = A \sqcup \{*\}$ .

# 4 Cohomology

# 4.1 Axiomatic Cohomology

**Definition 4.1.** A cohomology theory consists of

- 1. a family of contravariant functors  $h^n : \mathbf{TOP}(2) \to R \mathbf{MOD}$ ,
- 2. a family of natural transformations  $\delta^n \colon h^{n-1} \circ K \to h^n$ , where  $K \colon (X,A) \to (A,\varnothing)$  is the restriction, that satisfy
  - (a) H-Invariance:  $h^n(f_0) = h^n(f_1)$  if  $f_0 \simeq f_1$ .
  - (b) Exact Sequence: Given (X, A),

$$\cdots \longrightarrow h^{n-1}(A) \xrightarrow{\delta} h^n(X,A) \longrightarrow h^n(X) \longrightarrow h^n(A)$$

is exact.

(c) Excision: Given a pair (X, A) with  $U \subset A$  and  $\overline{U} \subset Int(A)$ , then the restriction  $h^n(X, A) \to h^n(X - U, A - U)$  is an isomorphism for any n.

**Definition 4.2.** A reduced cohomology theory is given by  $\widetilde{h}^n(X) := \ker(h^n(X) \to h^n(\{*\}))$  which fits into a splitting exact sequence

$$0 \longrightarrow h^n(X, *) \longrightarrow h^n(X) \longrightarrow h^n(*) \longrightarrow 0.$$

And we have  $\widetilde{h}^n(X) \cong h^n(X,*)$ .

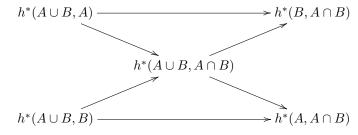

#### 4.1.1 Mayer-Vietoris Sequence

**Definition 4.3.** Given  $A, B \subset X$ , we say the pair (A, B) is excisive if the restriction  $h^*(A \cup B, A) \to h^*(B, A \cap B)$  is an isomorphism.

**Lemma 4.4.** The followings are equivalent:

- 1. (A, B) is excisive.
- 2. (B, A) is excisive.

*Proof.* The proof is given by chasing the following diagram.

# Part III Characteristic Classes
